Nuovo habitat proposto di interesse regionale codice CORINE 22.4311, sup.coperta 11% della superficie del sito. Rappresentatività B, sup.relativa C, grado conservazione B, valutazione globale B.

4.2 Quality and importance

Risulta essere uno degli ultimi lembi di ambiente palustre nella Pianura bresciana. Riveste un importante ruolo per l'avifauna sia stanziale sia migratoria. È luogo preferenziale per la nidificazione di molte specie palustri. E' inoltre un ambiente idoneo alla riproduzione di anfibi e rettili. Il sito si presenta come un mosaico di specchi d'acqua alternati a vecchi camminamenti su cui è presente una vegetazione naturale sia erbacea che arborea in parte alterata dall'ingresso di specie vegetali alloctone di origine nordamericana. Il resto dell'area è per gran parte occupato da ampie plaghe di vegetazione palustre, cariceti e magnocariceti, che caratterizzano marcatamente l'ambiente della Riserva. Gli specchi d'acqua, nelle parti meno profonde, sono occupate da un lamineto improntato essenzialmente a *Nymphaea alba*.
